

## MA719: Optimization by Vector Space Methods – Optima and Equilibria

**Instructor:** Patrick L. Combettes, [plc@math.ncsu.edu](mailto:plc@math.ncsu.edu)

**Term:** Spring 2021

**Time:** Tuesdays and Thursdays, from 10:15 to 11:30 (on-line delivery via moodle and zoom)

**Office hours:** Tuesdays and Thursdays from 11:35 to 12:35 (on-line by appointment)

**Course objectives:** The goal of modern optimization is the analysis and the construction of equilibria such as minimizers of functionals, saddle points, solutions to variational inequalities and monotone inclusions, solutions to minimax problems and games. This course provides an account of the essential tools of modern optimization in the setting of Banach spaces. The theoretical foundations will be developed from first principles and in tight interactions with application domains such as control theory, signal processing, game theory, partial differential equations, statistics, mechanics, inverse problems, machine learning, finance, and optimal transportation.

**Prerequisite:** Elementary knowledge of normed vector spaces.

**Content:** Theory and applications in the above areas will be intertwined. Main topics:

- Banach space theory
- Optima and equilibria
- Convex analysis
- Variational and minimization principles
- Regularization of minimization problems
- Notions of well-posedness
- Parametric duality in minimization problems
- Fixed point principles
- Minimax theory
- Monotone operator theory
- Kuhn-Tucker theory for monotone inclusions
- Variational inequalities
- Nash equilibria and games
- Equilibrium finding dynamics and algorithms

**Grading:** HW 35%, project 65%.
